

Independent Scanpy reanalysis of careg:EGFP dynamics in the regenerating zebrafish retina

Bise et al. 2023 · GEO GSE202212 · 15,893 cells · control, 3, 7 and 10 days post-MNU

A Injury model

MNU

outer nuclear layer
rods, UV cones

inner nuclear layer
bipolar, amacrine, Müller glia

ganglion cell layer

photoreceptor ablation → Müller glia activation

B careg:EGFP reproduces within 0.2 pp

C 13 populations from 15,893 cells

D Which conclusions survive a change of method

REPRODUCED

Reporter time course, within 0.2 pp at every timepoint
Müller glia enriched 3.75×, holding 42.6% of EGFP+ cells
All 23 tested genes of the published MG signature
Cone arr3a/arr3b inversion, exactly

NOT REPRODUCED

Rod immature/mature paralogs inversion
· fails at resolution 0.6 and at 0.2
· fails under Harmony batch correction
· no rhlo-high population exists in these data

ADDED HERE

Reporter survives depth stratification: 0% → 54.3%
Stressed rod population supports the capture-bias mechanism the published work inferred
DE directional skew tracks sequencing-depth imbalance
